NANHAO SU

Wuhan, China | sunanhao@hust.edu.cn | sunanhao528@gmail.com | github.com/nanhaosu

EDUCATION

Huazhong University of Science and Technology (HUST) | Sep 2025 - Jun 2029

B.Eng. in Electromagnetic Fields and Wireless Technology | Expected graduation: Jun 2029

Weighted average: 84.77/100 | Selected courses: Python (96/100), Data Structures (90/100), C Programming

RESEARCH INTERESTS

Trustworthy AI | LLM Agent Safety | Agent Memory Reliability | Privacy and Security Evaluation

RESEARCH EXPERIENCE

Trustworthy AI Research Group, HUST | Undergraduate Researcher | May 2026 - Present

Research mentor: Dr. Gaoyang Liu

- Investigated A-MEM and a fixed-version Mem0 release through controlled synthetic-data experiments, analyzing long-term memory updates, state consistency, and downstream retrieval behavior.
- Documented 54 A-MEM test configurations and 72 matched replay units; audited experiment traces, preserved negative cases, and scoped findings to tested implementations.
- Reviewed agent-memory security literature and developed preliminary evaluation protocols and pilot studies for long-horizon agent reliability in research-group discussions.

Provincial Undergraduate Innovation Project | Research Team Member | 2026 - Present

Lightweight LLM-based Telecom-Fraud Dialogue Analysis | Supervisor: Prof. Wei Yuan

- Adapted data augmentation approaches from TeleAntiFraud-28k (ACM MM 2025) and Bot Wars Evolved (2025), using Qwen and DeepSeek to augment a corpus of 66,699 fraud case descriptions and contributing to 10,000 generated, annotated dialogues.
- Refined prompts and contributed to synthetic dialogue quality assessment and model evaluation for lightweight LLM-based fraud detection.

SELECTED TECHNICAL PROJECTS

Agent Risk Audit | Python | Public repository | 2026 - Present

- Developed reproducible offline tooling to audit agent risk-rating records, preserving provenance and identifying missing, duplicate, or invalid evaluation entries.
- Checked a synthetic 10-record fixture with 11 passing unit tests and four blocked scoring/network probes; results are engineering checks, not model-performance claims.

FlowOps Engineering | Python / Node.js | 2026

- Built a stateful incident-coordination prototype with authorization revisions, persistent sessions, and recovery constraints; verified with 45 Python tests, 9 Node.js tests, and 36 synthetic trajectories.

Multimodal Anti-Fraud Data Pipeline | Python / Selenium / SQLite | Jul 2026

- Built a media collection and preprocessing workflow with speech-to-text components; organized 100+ audiovisual samples and metadata for subsequent quality review.

TECHNICAL SKILLS

Programming & ML: Python, C, PyTorch, Hugging Face Transformers, prompt development, model evaluation

Tools: Git/GitHub, Linux, LaTeX, Selenium, SQLite; basic familiarity with Docker

ADDITIONAL INFORMATION

English: CET-4 (528/710) | Research availability: Remote collaboration from January 15, 2027
